The listed attachments are an integral part of this report.

# 1. Summary of test results

The test results apply exclusively to the test samples as presented in this Report. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests.

Also we refer on special conditions which the applicant should fulfill according §2.927 to §2.948, special focus regarding modification of the equipment and availability of sample equipment for market surveillance tests.

The <u>Equipment Under Test</u> (in this report, hereinafter referred as EUT) is a digital device with no support of radiofrequency technologies. A typical operating mode (one or more) as used in the real usage was tested or a special test program simulating this was used. Pls. see chapter Operating-Mode for more details.

Following tests have been performed to show compliance with applicable FCC Part 15, Subpart B (Unintentional Radiators) of the CFR 47 Rules, Edition 1<sup>st</sup> October 2018 and Canadian ICES-003, Issue 6.

Remark:

#### 1.2. ATTESTATION

I declare that all measurements were performed by me or under my supervision and that all measurements have been performed and are correct to my best knowledge and belief to Innovation, Science and Economic Development Canada standards. All requirements as shown in above table are met in accordance with enumerated standards.

| Markus Ridder                | H. Laayouni                 |

| Responsible for test section | Responsible for test report |

### 2. Administrative Data

## 2.1. Identification of the testing laboratory

Company name: CETECOM GmbH

Address: Im Teelbruch 116

45219 Essen - Kettwig

Germany

Responsible for testing laboratory: Volker Wittmann

Deputy: Ninovic Perez

#### 2.2. Test location

#### 2.2.1. Test laboratory "CETECOM GmbH"

Company name: see chapter 2.1. Identification of the testing laboratory

## 2.3. Organizational items

Responsible for test report and

project leader: H. Laayouni
Receipt of EUT: 2020-01-21

Date(s) of test: 2020-01-22 to 2020-02-05

Date of report: 2020-02-12

\_\_\_\_\_

Version of template: 13.03

## 2.4. Applicant's details

Applicant's name: GROHE AG

Address: Industriepark Edelburg

58675 Hemer

Germany

Contact person: Ralf Oberste-Lehn

### 2.5. Manufacturer's details

Manufacturer's name: please see applicant's details

Address: please see applicant's details

# 4. Description of test system set-up's

### 4.1. Test system set-up for radiated electric field measurement 30 MHz to 1 GHz

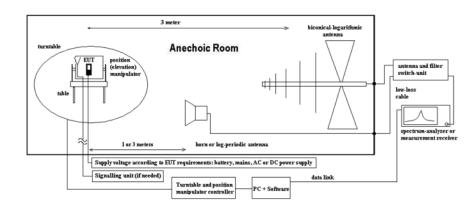

**Specification:** ANSI C63.4-2014 chapter 8.2.3, ANSI C63.10-2013 chapter 6.5

General Description: Evaluating the field emissions have to be done first by an exploratory emissions

measurement and a final measurement for most critical frequencies. The tests are performed in a NSA-compliant semi anechoic room (SAR) recognized by the

regulatory commissions.

**Schematic:** 

#### **Testing method:**

#### **Exploratory, preliminary measurements**

The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (range  $0^{\circ}$  to  $360^{\circ}$ , step  $90^{\circ}$ ) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.

Measurement antenna: horizontal and vertical, heights: 1.0 m and 1.82 m as worst-case determined by an exploratory emission measurements. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Formula:

$$E_C = E_R + AF + C_L + D_F - G_A$$
 (1)

$$M = L_T - E_C \tag{2}$$

#### Final measurement on critical frequencies

Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc. either on 10 m OATS or 3 m semi-anechoic room.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position). The measurement antenna height between 1 m and 4 m.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

AF = Antenna factor

 $C_L = Cable loss$ 

 $D_F$  = Distance correction factor (if used)

 $E_C$  = Electrical field – corrected value

 $E_R = Receiver reading$ 

 $G_A$  = Gain of pre-amplifier (if used)

$$\begin{split} L_T &= Limit \\ M &= Margin \end{split}$$

All units are dB-units, positive margin means value is below limit.

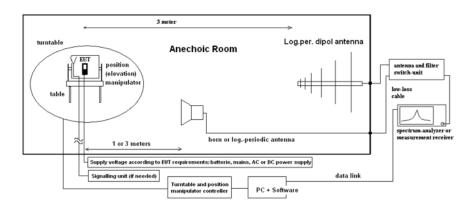

### 4.2. Test system set-up for radiated electric field measurement above 1 GHz

**Specification:** ANSI C63.4-2014 chapter 8.3, ANSI C63.10-2013 chapter 6.6.3.3 & 6.6.4

**General Description:** 

Evaluating the emissions have to be done first by an exploratory emissions measurement and a final measurement for most critical frequencies. The tests are performed in a CISPR 16-1-4:2010 compliant fully anechoic room (FAR) recognized by the regulatory commission. The measurement distance was set to 3 meter for frequencies up to 18 GHz and 2 meter above 18 GHz. A logarithmic periodic antenna is used for the frequency range 30 MHz to 1 GHz. Horn antennas are used for frequency range 1 GHz to 40 GHz. The EUT is aligned within 3 dB beam width of the measurement antenna with three orthogonal axis measurements on the EUT.

**Schematic:** 

### **Testing method:**

#### **Exploratory, preliminary measurements**

The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 1.55 m height which is placed on the turntable. By rotating the turntable (range  $0^{\circ}$  to  $360^{\circ}$ , step  $15^{\circ}$ ) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.

The measurements are performed in horizontal and vertical polarization of the measurement antennas. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Formula:

$$E_C = E_R + AF + C_L + D_F - G_A$$
 (1)

$$M = L_T - E_C \tag{2}$$

### Final measurement on critical frequencies

Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined. Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself over 3-orthogonal axis and the height for EUT with large dimensions.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out. On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

 $E_C$  = Electrical field – corrected value

 $E_R$  = Receiver reading

M = Margin

 $L_T = Limit$ 

AF = Antenna factor

 $C_L = Cable loss$ 

 $D_F$  = Distance correction factor (if used)

 $G_A = Gain of pre-amplifier (if used)$ 

All units are dB-units, positive margin means value is below limit.

Remark: see diagrams in annex 1 for more details

#### **5.3.** Measurement uncertainties

The reported uncertainties are calculated based on the standard uncertainty multiplied with the appropriate coverage factor  $\mathbf{k}$ , such that a confidence level of approximately 95% is achieved.

For uncertainty determination, each component used in the concrete measurement set-up was taken in account and it is contribution to the overall uncertainty according it's statistical distribution calculated.

Following table shows expectable uncertainties for each measurement type performed.

| RF-Measurement                  | Reference    | Frequency range                                      | Calculated uncertainty based on a confidence level of 95% |            |         |         | ı a                         | Remarks |                                              |  |
